To import a Landslide generated TLS secret for viewing in Wireshark, you will need to have the test server UE info level configured in TS-Admin.
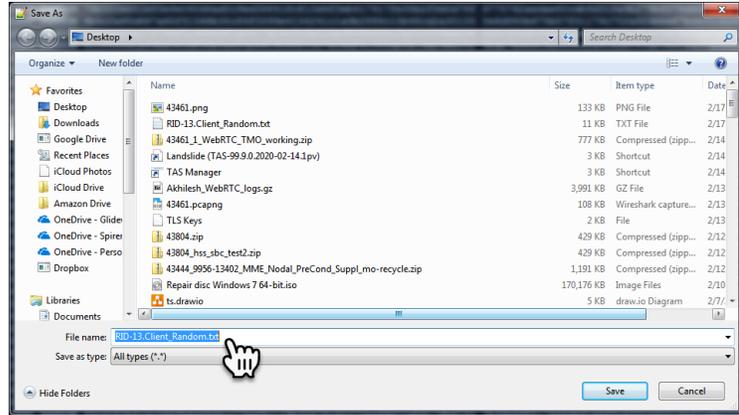

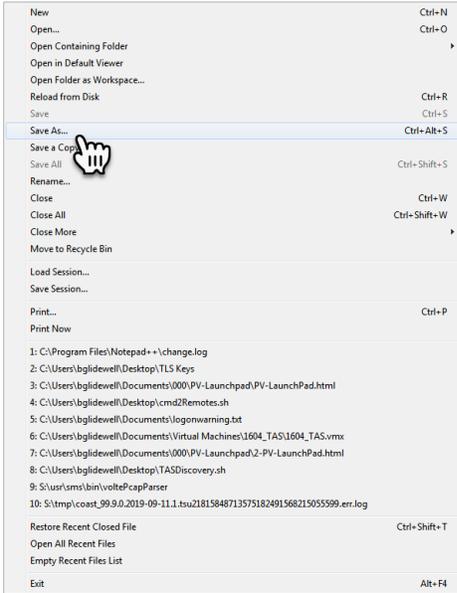

On the test session Info tab, select configure and enabled checkbox.

After the test run, there will be an info report generated in the test results web page. Choose this link which will open a Microsoft Excel Spreadsheet.

Use the Excel application to select and copy the "COLVALUE" column, "CLIENT RANDOM" cells from the spreadsheet to the clip board.

Paste _only_ these values into a text editor such as Notepad++.

Save this new text file for importing into Wireshark.

In Wireshark, select [Edit][Preferences] then [protocols], then [TLS], then under (Pre)-master-secret log filename, browse to your saved text file. (click OK)
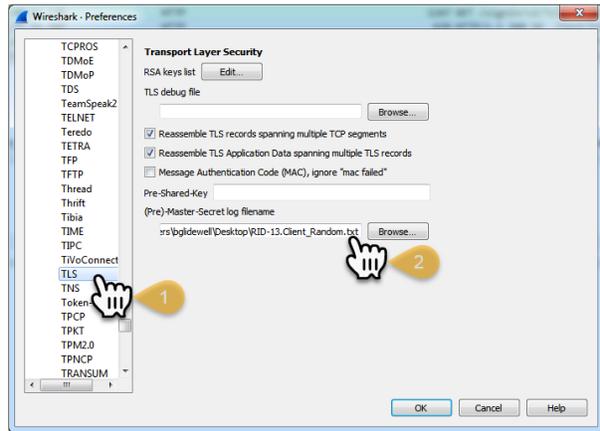

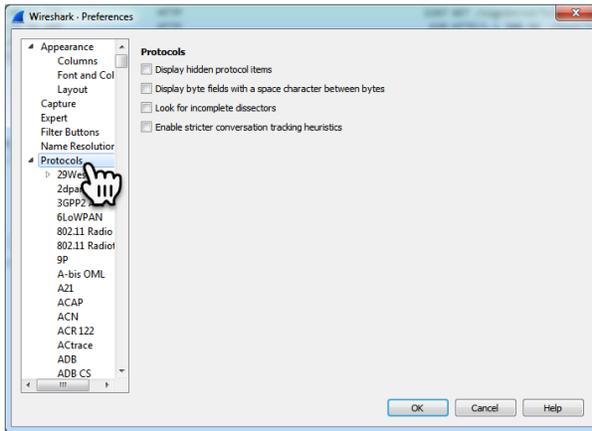

You should now be able to view the Encrypted TLS packets.
